## Office Action Summary

Application No.

10/021,533

Applicant(s)

KONOWALCHUK ET AL.

Examiner

San-ming Hui

Art Unit

1617

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 29 December 2003.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 1-9, 11-22 and 24-34 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-9, 11-22, and 24-34 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
  - ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

### **DETAILED ACTION**

Applicant's amendments filed December 29, 2003 have been entered.

Claims 1-9, 11-22, 24-34 are pending.

### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-6, 9, 11-22, 24-34 are rejected under 35 U.S.C. 103(a) as being unpatentable over Yu et al. (US Patent 5,385,938) in view of Poli et al. (Food Chemistry, 1979; 4(3): 251-258, reference of record), Wenninger (International Cosmetic Ingredient Dictionary and Handbook, 7<sup>th</sup> ed., Vol. 1, page 163-168), Merck Index (11<sup>th</sup> ed., 1989, Glycolic acid monograph 4394, page 4399), and Pamukoff, reference of record.

Yu et al. teaches a topical composition with glycolic acid is the active and about 12.4% ethanol as solvent (See col. 14, Example 1). Yu et al. also teaches that the composition has pH of 3.0 (See col. 14, Example 1). Yu et al. also teaches that the glycolic acid composition is useful to eradicate lesions such as warts, which is a viral infection of papillomas virus (See col. 30, line 10 – col. 31, line 2). Yu et al. also teaches that other pharmaceutically acceptable vehicles other than water and ethanol may be used (See col. 13, lines 11-13). Yu et al. also teaches that the concentration of hydroxyacids, including glycolic acid, may range from 0.02 to 12M (See col. 13, lines

Art Unit: 1617

17-19). Yu et al. also teaches that the composition may be formulated into gel, ointment, cream, lotion, and other cosmetic and pharmaceutical preparation (See col. 13, lines 4-6).

Yu et al. does not expressly teach 1,3-butanediol, as known as butylenes glycol, is useful as pharmaceutical vehicle. Yu et al. does not expressly teach that the glycolic acid containing topical composition as useful in treating lesions caused by viruses within the Herpesviridae. Yu et al. does not expressly teach the composition having a specific pH of 2.45.

Poli et al. teaches that glycolic acid is virucidal against herpevirus, orthomyxovirus (influenza virus), and Rhabdovirus (See particularly page 253, Table 1).

Wenninger teaches that butylenes glycol as useful as solvent in numerous cosmetic marketed products (See page 163-168).

Merck Index teaches that the pH 0.5% of glycolic acid solution as 2.50 (See the glycolic acid monograph). Examiner notes that 0.5% of glycolic acid is about 0.31M.

Pamukoff teaches that 1-10% ethyl alcohol containing composition for treating viral infections broadly, in particularly the infections that are caused by Herpes virus such as Herpes Simplex 1, Herpes Simplex 2, and common cold viruses (See particularly page 2, first paragraph; also page 7-9, Examples 2-5; also claims 1 and 2). Pamukoff also teaches that this antiviral composition can be formulated into creams (See particularly page 2, line 3).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to employ butylenes glycol as solvent in the topical composition of

Art Unit: 1617

Yu et al. and adjust the pH to 2.45 and use it to treat viral infection or lesions. It would have been obvious to one of ordinary skill in the art at the time the invention was made to employ the glycolic acid containing topical composition, in the herein claimed concentration, in the treatment of lesions caused by viruses belong to the Herpesviridae family.

One of ordinary skill in the art would have been motivated to employ butylenes glycol as solvent in the topical wart-treating composition of Yu et al. and adjust the pH to 2.45. Butylenes glycol is known to be useful in cosmetic products as solvent. Employing any known topically acceptable solvents, including butylene glycol, into a topical composition would have been reasonably expected to be useful in formulating a topical composition and using it to treat viral infection or lesions. Moreover, the optimization of result effect parameters (e.g., pH of the composition and the amount of active (glycolic acid)) is obvious as being within the skill of the artisan based on the teaching of Merck Index, absent evidence to the contrary.

One of ordinary skill in the art would have been motivated to employ the glycolic acid containing topical composition to treatment of lesions caused by viruses of the Herpesviridae family. Based on the teachings of Poli et al. and Yu et al., glycolic acid is known to be effective in killing herpes virus. Therefore, applying a glycolic acid composition would have been reasonably expected to be effective in treating lesions caused by the same virus.

Pamukoff provides an additional motivation to combine the composition of Pamukoff and Yu et al. to form a glycolic acid-ethanol-containing composition useful in

Art Unit: 1617

the instant method. Both compositions are known to be useful in activating herpes virus individually. It flows logically to combine these compositions useful for the very same purpose, absent evidence to the contrary (See *In re Kerkhoven* 205 USPQ 1069).

Claims 1 and 7-8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Bhatia et al. (Indian Journal of Animal Sciences 1998; 68(6): 518-520, reference of record) and Pamukoff (Canadian Patent: CA 122164, reference of record).

Bhatia et al. teaches that 0.4N hydrochloric acid is effective in inactivating sheep pox virus (See particularly page 519, col. 1, Table 1 and col. 2, third paragraph). Bhatia et al. also teaches that the "Ranch" strain of goat pox virus is more sensitive in acidic pH 3.0 as there was 5 log fall in the titer in the acidic pH (See page 519, col. 2, third paragraph).

Pamukoff teaches that 1-10% ethyl alcohol containing composition for treating viral infections broadly, in particularly the infections that are caused by Herpes virus such as Herpes Simplex 1, Herpes Simplex 2, and common cold viruses (See particularly page 2, first paragraph; also page 7-9, Examples 2-5; also claims 1 and 2). Pamukoff also teaches that this antiviral composition can be formulated into creams (See particularly page 2, line 3).

The references do not expressly teach the herein claimed viral lesion-treating method employing a composition comprises both ethanol and hydrochloric acid. The references do not expressly teach the pH of the composition used in the virus-lesion-treating method as 2.45.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to employ a composition comprises both ethanol and hydrochloric acid in a method for treating viral lesions. It would have been obvious to one of ordinary skill in the art at the time the invention was made to adjust the pH of the composition to 2.45.

One of ordinary skill in the art would have been motivated to employ a composition comprises both ethanol and hydrochloric acid in a method for treating viral lesions. Both the composition of Bhatia et al. and Pamukoff are known to be useful in treating herpes viral infection individually. Therefore, it flows logically to combine the two composition which are known to be useful to treat viral lesions individually into a single composition useful for the very same purpose is prima facie obvious (See *In re Kerkhoven* 205 USPQ 1069). Furthermore, optimization of the pH to 2.45 would be considered obvious as being within the purview of skilled artisan since the pH of the composition is essentially the amount of acid added. Absent showing evidence of the criticality of the specific amount of acid added, to adjust the effective amount of acid from pH 3.0 to 2.45 would be considered obvious as being within the purview of the skilled artisan.

As regard to the data showing synergistic results, they are not convincing (please see the discussion in the office action mailed October 28, 2002, page 8).

### ***Response to Arguments***

Applicant's arguments filed December 29, 2003 averring the amphoteric compounds, which are required to be in the composition in order to produce an pH of 2.45, being excluded by the claims as amended have been fully considered but they are not persuasive. Although in the pH of the particular example of Yu without the pseudoamphoteric compound is 1.9, Yu teaches the effective amount of glycolic acid can be in the range of 0.02 to 12M (See col. 13, lines 17-19). As discussed in the rejections above, when the concentration of glycolic acid is about 0.31 M, the pH is about 2.5, which falls within the herein claimed range. Moreover, Yu et al. clearly disclosed that the amphoteric compounds are not necessarily present in the composition of Yu et al. in order to have antiviral activities (See col. 11, lines 55-59). The transitional phrase "consisting essentially of" limits the scope of a claim to the specified materials or steps and those that do not materially affect the basic and novel characteristic of the claimed invention. For the purpose of searching for and applying prior art under 35 USC 102 and 103, absent clear indication in the specification or claims of what the basic and novel characteristics actually are, "consisting essentially of" will be construed as equivalent to "comprising" See, e.g., PPG, 156 F.3d at 1355, 48 USPQ2d at 1355. ("PPG could have defined the scope of the phrase consisting essentially of" for purposes of its patent by making clear in its specification what it regarded as constituting a material change in the basic and novel characteristics of the invention."). When an applicant contends that additional steps or materials in the prior art are excluded by the recitation of "consisting essentially of," applicant has the burden of showing that the introduction of additional steps or components would materially

Art Unit: 1617

change the characteristics of applicant's invention. *In re De Lajarte*, 337 F.2d 870, 143 USPQ 256 (CCPA 1964). See also *Ex parte Hoffman*, 12 USPQ2d 1061, 1063-64 (Bd. Pat. App. & Inter. 1989) ("Although consisting essentially of" is typically used and defined in the context of compositions of matter, we find nothing intrinsically wrong with the use of such language as a modifier of method steps. . . [rendering] the claim open only for the inclusion of steps which do not materially affect the basic and novel characteristics of the claimed method. To determine the steps included versus excluded the claim must be read in light of the specification. . . . [I]t is an applicant's burden to establish that a step practiced in a prior art method is excluded from his claims by "consisting essentially of" language.") (See MPEP 2111.03).

Applicant's rebuttal arguments file December 29, 2003 averring the cited prior art's failure to teach glycolic acid as effective in treating lesions caused by herpes or pox virus, have been considered, but are not found persuasive. Although the cited prior art not expressly teaches the treatment effectiveness, based on the teachings of Poli et al. and Yu et al., glycolic acid is known to be effective in killing herpes virus. Therefore, applying a glycolic acid composition to reduce the number of herpes viruses, and thereby treating herpes viruses causing lesions, would have been reasonably expected to be effective.

Applicant's rebuttal arguments file December 29, 2003 averring the cited prior art's failure to provide motivation to incorporate 1,3-butanediol into the herein claimed method, have been considered, but are not found persuasive. 1,3-butanediol is known as a commonly used solvent for pharmaceutical use. Incorporating such commonly

used solvent in pharmaceutical art into the pharmaceutical composition of Yu for treatment of viral infection would be obvious as the selection of one or another commonly used solvent would be seen as a simple selection from among obvious alternatives.

Applicant's rebuttal arguments file December 29, 2003 averring the cited prior art not teaching the critical features of the herein claimed invention have been considered, but are not found persuasive. As discussed above, the claims herein are given the broadest reasonable interpretation and thus, the herein recited method of treating lesions caused by herpes or pox viral infection employing a composition having an alcohol and an acid. As discussed above, the cited prior art, when taken together, clearly renders the herein claimed invention obvious. The citing of Merck Index merely showed that the pH of glycolic in different concentration is well-known in the art.

Applicant's rebuttal arguments averring Pamukoff have been considered, but are not found persuasive. The claims herein recite a composition "consisting essentially of" an alcohol and an acid. As discussed above, it is considered as comprising when applying art rejection under 35 USC 102 and 103. The cited prior art, when taken as a whole, teaches the same components useful for treating viral infection. Applicant argues that 10% alcohol is effective only when alkali metal halide salt and glycerine are added to the composition. Please note that the addition of alkali metal salt and glycerine do not change the basic and novel characteristics of the herein claimed invention: effective treatment for herpes and pox viral infection. Applicant does not demonstrate any evidence that the addition of glycerine and alkali metal halide salt

would change the basic and novel characteristic of the herein invention. Absent evidence to the contrary, one of ordinary skill in the art would have been motivated to employ the composition as the cited prior arts suggested, in the method of treating lesions and/or inflammation of herpes and/or pox viral infection.

In response to applicant's argument that the examiner's conclusion of obviousness is based upon improper hindsight reasoning, it must be recognized that any judgment on obviousness is in a sense necessarily a reconstruction based upon hindsight reasoning. But so long as it takes into account only knowledge which was within the level of ordinary skill at the time the claimed invention was made, and does not include knowledge gleaned only from the applicant's disclosure, such a reconstruction is proper. See *In re McLaughlin*, 443 F.2d 1392, 170 USPQ 209 (CCPA 1971). In the instant case, both the composition of Bhatia et al. and Pamukoff are known to be useful in treating herpes viral infection individually. Therefore, it flows logically to combine the two composition which are known to be useful to treat viral lesions individually into a single composition useful for the very same purpose is prima facie obvious (See *In re Kerkhoven* 205 USPQ 1069).

Applicant's rebuttal arguments averring Bhatia not teaching the herein claimed method of treatment for lesions caused by herpes and/or pox viral infection have been considered, but are not found persuasive. Although the cited prior art not expressly teaches the treatment effectiveness, based on the teachings of Bhatia et al., hydrochloric acid is known to be effective in killing pox virus. Therefore, applying a

Art Unit: 1617

hydrochloric acid composition to reduce the number of pox viruses, and thereby treating pox viruses causing lesions, would have been reasonably expected to be effective.

Applicant's rebuttal arguments averring Pamukoff and Bhatia's failure to suggest the combination of hydrochloric acid and ethanol in the method to treat lesions and/or inflammation caused by herpes and/or pox viruses have been considered, but are not found persuasive. As discussed above, the employment of both agents, both known antiviral agents, would have been reasonably expected to exert the very same antiviral effect, and thus, useful as effective treatment of herpes and/or pox viral infections thereby, absent evidence to the contrary.

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to San-ming Hui whose telephone number is (703) 305-1002. The examiner can normally be reached on Mon 9:00 to 1:00, Tu - Fri from 9:00 to 6:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Sreeni Padmanabhan, PhD., can be reached on (571) 272-0629. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
